

DIGIMIC lean⁺

An entirely new perspective

brähler
SYSTEMS

Architecture, Design and Conference Technology

One of our aims was to be able to view conference technology as a natural and simply integratable component of the overall plan. The combination of modern DIGIMIC technology with additional power and data supply options individually customised as needed is consistently coordinated in a way that enables numerous new options and freedoms for integration.

Two strong concepts joined together

In order to be able to create such a product, two strong and experienced companies came together to combine their respective strengths. Brähler ICS and Bachmann. DIGIMIC lean⁺ from Brähler and Bachmann Facility Solutions complement each other perfectly in this new concept.

Radically different.

DIGIMIC lean+ is different from all other conference technologies! Not just because we have miniaturised the technology of the microphone station to such an extreme degree that it takes up very little space. Its significant miniaturisation also makes the microphone station more compact, more visually appealing and most of all more flexible. It has therefore become a high-performance platform for precise integration.

Fits with any style

We have designed DIGIMIC so that it is integratable anywhere, fitting with the style of the company. Flexible in form and function, as tabletop models or models integrated into the table, elegant to nearly invisible.

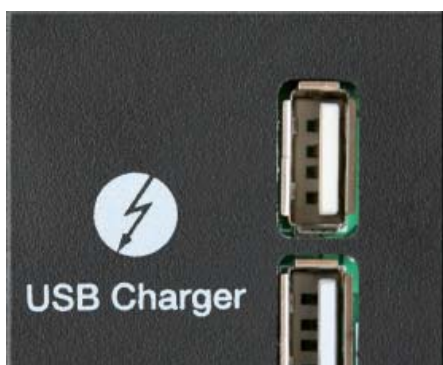

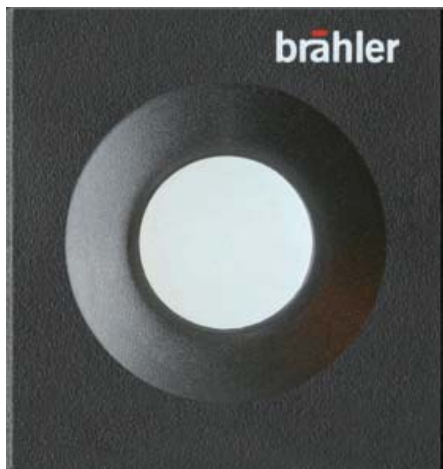

Flexibility through modular design

Our principle: All of the functions of a microphone station can be flexibly combined with one another, arranged and expanded with the widest variety of data and media connections. That's DIGIMIC lean+. Each individual DIGIMIC component was redesigned, miniaturised to an extreme degree and optimised for flexibility so that you can take exactly what you need from the resulting basic modules. Not more and not less — always the right thing for the respective application, completely according to your demands and desired function. DIGIMIC lean+ makes it possible.

DIGIMIC technology

DIGIMIC is the high-performance all-rounder from Brähler. It was developed for all sizes of events and numbers of delegates and allows the integration of just a few to up to several thousand units in one system. DIGIMIC is nearly intuitive to use, always ready for operation at the press of a button and can be used as a standalone system or controlled using software applications, depending on your choice.

Your personal decision!

In addition to the technical options, the art of furnishing a conference space with conference technology lies in the perfection of integration. „Perfection“ means individual access to the conference technology, energy and data supply in the most elegant and discrete way. This is true for conference and training tables as well as high-quality workstations.

All of the functions of conference technology — in modular construction. For flexible combination and expansion with the widest variety of data and media connections.

Easy planning with DIGIMIC

Our modular concept simplifies the planning and harmonious integration of conference technology, data supply and power supply in a modern, design-oriented building architecture.

Individually coordinated...

discuss

listen through headphones

understand various languages

DIGIMIC discussion unit with installation frame is a compact and timeless solution that offers nearly unlimited application options due to the easy access to its technology.

DIGIMIC with an aluminium cover is an elegant and well-designed solution that protects the technology from dust and dirt.

DIGIMIC can also be flexibly installed into the furniture without interference and fastened to the tabletop in a space-saving way with the aid of elegant aluminium frames with angle brackets, whereby the cables are discretely fed behind a screen.

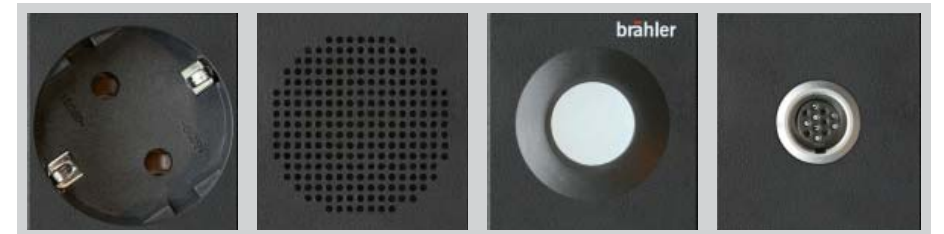

DIGIMIC with additional data and power supply when it is needed and easily retractable when not.

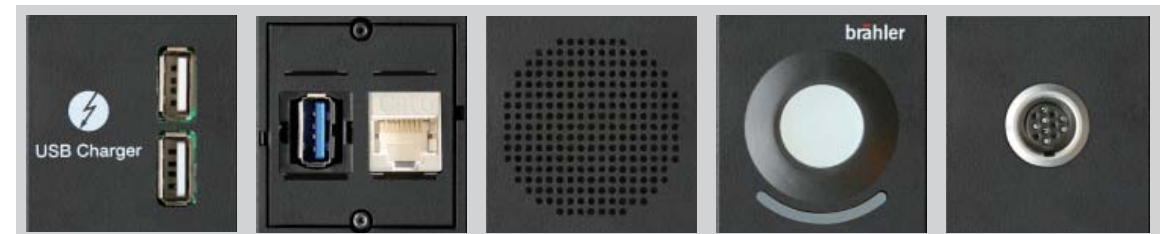

The microphone and microphone button, the most important components of a conference system, are always elegantly and discretely available. All further components are clean and ready for use as needed under an aluminium cover.

...and perfectly integrated.

always have energy

be connected with the world

identify, vote and coordinate with one another
